Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/990,995	Applicant(s) CHUNG, CHIEN-PING	
	Examiner Clifford H Knoll	Art Unit 2112	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 July 2004.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-12, 14-15 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-12, 14-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

This Office Action is responsive to communication filed 7/23/2004. Claim 13 has been cancelled. Currently claims 1-12 and 14-15 are pending.

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 102

Claims 6 and 8-15 are rejected under 35 U.S.C. 102(e) as being anticipated by Klinger (US 6523071).

Regarding claim 6, Klinger discloses at least one latching device, wherein said latching device has a triggering terminal and an output terminal, said triggering terminal couples with a configuration diagnostic signal lead of said IDE bus and said output terminal couples with a signal detection terminal of said detection device (e.g., col. 2, lines 59-67), where the latching device further includes a clear terminal such that said output terminal of said latching device is reset to a low potential when said clear terminal is triggered by a system reset signal (e.g., col. 6, lines 60-61).

Regarding claim 8, Klinger also discloses a general-purpose input/output (GPIO) controller (e.g., col. 6, lines 3-6).

Regarding claim 9, Klinger also discloses an integrated drive electronic (IDE) interface controller (e.g., col. 1, lines 30-36).

Regarding claim 10, Klinger also discloses an 80-pin connection or a 40-pin connection (e.g., col. 2, lines 43-46).

Regarding claim 11, Klinger also discloses the IDE bus is diagnosed as one having an 80-pin cable by said detection device if said output terminal of said latching device outputs a low potential to said signal detection terminal of said detection device (e.g., col. 6, lines 55-59).

Regarding claim 12, Klinger also discloses IDE bus is diagnosed as one having a 40-pin cable by said detection device if said output terminal of said latching device outputs a high potential to said signal detection terminal of said detection device (e.g., col. 6, lines 55-59).

Regarding claim 14, Klinger also discloses the device outputs a high potential when said triggering terminal of said latching device receives any signal variation (e.g., col. 6, lines 62-64).

Regarding claim 15, Klinger discloses a general purpose input/output (GPIO) controller having: a detection device having at least one of signal detection terminal for detecting IDE bus cable configuration (e.g., col. 3, lines 54-57); and a plurality of latching devices connected to said IDE bus cable and said detection device wherein each said latching device has a triggering terminal, a clear terminal and an output terminal, said triggering terminal coupling with a signal lead of said IDE bus (e.g., col. 6, lines 34-39); said clear terminal triggered by a system reset so that said output terminal

of said latching device is reset to a low potential (e.g., col. 6, lines 60-61), and when said triggering terminal of said latching device receives any signal variation, said output terminal of said latching device outputs a high potential, wherein when said output terminal of said latching device outputs a low potential to said signal detection terminal of said detection device, said IDE bus is diagnosed as having an 80-pin cable configuration, and when said output terminal of said latching device outputs a high potential, aid IDE bus is diagnosed as having a 40-pin cable configuration (e.g., col. 6, lines 57-60).

Claim Rejections - 35 USC § 103

Claims 1-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Klinger in view of common digital design techniques, as evidenced by Rackley (US 5365122).

Regarding claim 1, Klinger discloses a general-purpose input/output (GPIO) controller having at least one signal detection terminal for detecting IDE bus cable configuration (e.g., col. 5, lines 43-46); and a D-type flip-flop having a triggering terminal, a clear terminal, an output terminal and a data input terminal, wherein a triggering terminal couples with a signal pin of said IDE bus, said output terminal couples with said signal detection terminal of said GPIO controller, said clear terminal couples with a system reset terminal (e.g., col. 6, lines 60-61); wherein said clear

terminal can be triggered by a system reset so that said output terminal of said D-type flip-flop is reset to a low potential (e.g., col. 6, lines 41-47), and when said triggering terminal of said D-type flip-flop receives any signal variation, said output terminal of said D-type flip-flop outputs a high potential; and when said output terminal of said D-type flip-flop outputs a low potential to said signal detection terminal of said GPIO controller, said IDE bus is diagnosed as one having an 80-pin cable configuration, and when said output terminal of said D-type flip-flop outputs a high potential to said signal detection terminal, said IDE bus is diagnosed as having a 40-pin cable configuration (e.g., col. 7, lines 44-48). Klinger is expressly silent about the implementational details of using the triggering terminal of a D flip flop; however the Examiner takes Official Notice that it is widely known and practiced to use the clock input of a flip flop to sense signal variation. This is evidenced by Rackley who describes precisely this (e.g., Figure 1a). It would have been obvious to combine common digital design techniques with Klinger because the requirements of Klinger's sampling of a floating line, the details of which are expressly not disclosed, are commonly, simply, and advantageously solved by the well known technique of using a clock input on a flip flop. Therefore it would have been obvious to one of ordinary skill in the art to combine common practice with Klinger to obtain the claimed invention.

Regarding claim 2, Klinger also discloses wherein said latching device has a triggering terminal, a clear terminal and an output terminal, triggering terminal couples with a signal lead of said IDE bus and said output terminal couples with a signal detection terminal of said detection device (e.g., col. 6, lines 41-47); said clear terminal

Art Unit: 2112

can be triggered by a system reset (e.g., col. 6, lines 60-61) so that said output terminal of said latching device is reset to a low potential, and when a triggering terminal of said latching device receives any signal variation, said output terminal of said latching device outputs a high potential; when said output terminal of said latching device outputs a low potential to a signal detection terminal of said detection device, said IDE bus is diagnosed as having an 80-pin cable configuration, and when said output terminal of said D-type flip-flop outputs a high potential to said signal detection terminal, said IDE bus is diagnosed as having a 40-pin cable configuration (e.g., col. 7, lines 44-48).

Klinger is expressly silent about the implementational details of using the triggering terminal of a D flip flop; however the Examiner takes Official Notice that it is widely known and practiced to use the clock input of a flip flop to sense signal variation. This is evidenced by Rackley who describes precisely this (e.g., Figure 1a). It would have been obvious to combine common digital design techniques with Klinger because the requirements of Klinger's sampling of a floating line, the details of which are expressly not disclosed, are commonly, simply, and advantageously solved by the well known technique of using a clock input on a flip flop. Therefore it would have been obvious to one of ordinary skill in the art to combine common practice with Klinger to obtain the claimed invention.

Regarding claim 3, Klinger also discloses D-type flip-flop having a clear terminal such that said clear terminal couples with a system reset terminal and said data input terminal couples with a terminal having a high potential. Klinger is silent on

Art Unit: 2112

implementational details of the sampling circuit, but it is common practice of input a level to the data input and evidenced by Klinger (e.g., Figure 1a), as detailed supra.

Regarding claim 4, Klinger also discloses a general-purpose input/output (GPIO) controller (e.g., col. 6, lines 3-6).

Regarding claim 5, Klinger also discloses an integrated drive electronic (IDE) interface controller (e.g., col. 1, lines 30-36).

Claims 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Klinger as applied in claim 6 above, in view of common digital design techniques, as evidenced by Rackley.

Regarding claim 7, Klinger discloses a D-type flip-flop having a clear terminal and a data input terminal such that said clear terminal couples with a system reset terminal (e.g., col. 6, lines 41-47). Klinger is expressly silent about the implementational details of using the triggering terminal of a D flip flop; however the Examiner takes Official Notice that it is widely known and practiced to use the clock input of a flip flop to sense signal variation. This is evidenced by Rackley who describes precisely this (e.g., Figure 1a). It would have been obvious to combine common digital design techniques with Klinger because the requirements of Klinger's sampling of a floating line, the details of which are expressly not disclosed, are commonly, simply, and advantageously solved by the well known technique of using a clock input on a flip flop. Therefore it would have been obvious to one of ordinary skill in the art to combine common practice with Klinger to obtain the claimed invention.

Response to Arguments

Regarding claim 6, Applicant argues that Klinger "does not teach the feature of '... wherein said latching device further includes a clear terminal such that said output terminal of said latching device is reset to a low potential when said clear terminal is triggered by a system reset signal'" (p. 7); and argues that Klinger's circuit "has its own reset control signal" which differs from the claimed invention whose latches are reset by the system reset signal; however Klinger provides precisely for a system reset signal to reset the latches as cited from Klinger supra and "the use of a D-latch having its own

Art Unit: 2112

reset control or any other circuit" (col. 6, lines 44-45). The distinction that is argued by Applicant of arranging the internal reset "to occur before the main system reset control signal" is inaccurate. The reset of latches in Klinger is disclosed to be responsive to the system reset and arranged to occur "before the main system reset control signal on lead 42" (col. 6, lines 25-26); the system reset being referred to in this passage as occurring on this particular lead is the *delayed* system reset signal being propagated to the connectors; this does not negate the reset of latches responsive to system reset. The existence of a delayed system reset signal in a particular portion of Klinger's overall invention does not negate the use of system reset to clear the latches used in anticipation of that feature in the claimed invention.

Regarding claim 15, Applicant argues that "Klinger does not teach the feature of '... a plurality of latching devices connected to said IDE bus cable and said detection device; wherein each said latching device has a triggering terminal, a clear terminal and an output terminal...said clear terminal triggered by a system reset so that said output terminal of said latching device is reset to a low potential...'"; and distinguishes Klinger by arguing that "the sampling circuit needs a reset signal previous to the system reset for normal operation, and therefore a single system reset cannot make Klinger work correctly" (p. 9); however, a *single* system reset is not recited; specifically claim 15 recites, "said clear terminal triggered by a system reset so that said output terminal of said latching device is reset to a low potential". Furthermore, this characterization of Klinger is not found in Klinger, who merely discloses that the reset is applied in the latching device before it is transmitted to the connector (e.g., col. 6, lines 24-26). This is

the system reset that triggers the output terminal of the latching device, as cited from Klinger supra and “the use of a D-latch having its own reset control or any other circuit” (col. 6, lines 44-45).

Regarding claim 1, Applicant argues similarly, distinguishing Klinger as disclosing “the sampling circuit needs a reset signal previous to the system reset for normal operation, and therefore a single system reset cannot make Klinger work correctly” (p. 9); however, as stated supra, this mischaracterizes Klinger. While Klinger discloses the use of a D flip-flop, he does not specify the particular use of the triggering input, but this is a common technique, as evidenced by Rackley. Therefore, Rackley is relied upon to disclose an *express* form of using a D flip-flop, whose *general* use is expressly observed by Klinger. The distinction of a single system reset finds no support in the claims, and, regarding the feature of resetting the latch, mischaracterizes the operation of Klinger. Klinger delays the transmission of the reset to the connector, but the invention as claimed does not distinguish from this particular feature of Klinger.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not

mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Clifford H Knoll whose telephone number is 571-272-3636. The examiner can normally be reached on M-F 0630-1500.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark H Rinehart can be reached on 571-272-3632. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
